

Jayden Salmon and Anthony Lopez-Hernandez

To Do list for Universal gaming controller

Hardware:

- Be able to use a rechargeable Battery
- The controller is going to need USB C port to charge the rechargeable battery and connect to game systems
- Headphone Jack to be able to use microphone
- Figure out if it is possible to use vibration motors so that the controller can vibrate to match the event in game
- Leds to show how much charge the controller has
- Options to change the physical buttons so that it can match what game system it is being used on
- Option for the controller to eventually be able to function as a bluetooth controller

Software:

- Figure out how much delay there is from the input of the controller to the gaming system used
- Find a way to program the controller so that it can used with different gaming systems as needed (like xbox, playstation, pc, and Nintendo)
- When the controller is being used as a bluetooth controller find a way to program it so can be pairable to different bluetooth systems
- Find a way that the controller can be updated so it could still be used when newer systems are released in the future
